

Cannabis Oil Now Available In All 50 States

Gadgetpush.com, June 8, 2018

(Health Review) – If you haven't already heard, [CBD](#) is a non-psychoactive component of Cannabis that seems to have a wide range of therapeutic benefits. [CBD](#) is naturally occurring in the Hemp plant and according to the United States own government patent #6,630,507 "it supports the nutritional health of aging bodies. Cannabinoids are found to have particular application as neuroprotectants, for example in limiting neurological damage following stroke and trauma, or in the treatment of neurodegenerative diseases, such as Alzheimer's disease and Parkinson's disease."

Some benefits scientists suggest people are getting from [Seralabs CBD Oil](#)

- Reduced feelings of anxiety
- Reversing brain damage caused by alcohol
- Anti-inflammatory, neuro-protective, and anti-oxidant

We decided to see what expert medical doctors and product users had to say about [Seralabs CBD Oil](#), and the results were surprising. In fact, Dr. Sanjay Gupta, a neurosurgeon, a medical professor and an Emmy award-winning chief medical correspondent concluded "The science is there. This isn't anecdotal. We have been terribly and systematically misled for nearly 70 years in the United States."

For long term health and wellness use, [CBD](#) is one of the best ways to keep a body healthy. Studies suggest, for specific ailments, [CBD](#) may help in many ways:

Anxiety	Pain/Chronic Pain
Inflammation	Spasms
Sleep Disorders	Rheumatoid Arthritis
Diabetes	Alcoholism
MS	Schizophrenia
PTSD	Epilepsy
Neuro Disorders	Parkinson's

Supplement Facts

Serving Size: 2 pumps
Servings per container: 80 approx.

Amount Per Serving	% Daily Value
Cannabidiol (CBD) (from Hemp Oil, aerial parts)	1.25 mg **

** Daily Value not established

Other Ingredients: Sunflower lecithin, MCT oil (from coconut), clover honey, organic vegetable glycerin, peppermint oil.

▼ USAGE

Read on: Stress, Your Heart and [CBD](#)

We also learned that most scientists agree that decreasing stress levels play a part in battling cancer, heart disease and other stress related illness.

[CBD](#) is available in many different forms. One of them is in a [Tincture Oil](#). Tinctures are also easier to give to children as they have to take only small amounts. CBD Tincture was designed to have the highest CBD absorption rate available. Because they are taken directly under the tongue, they enter the bloodstream much more directly than by any other means. (except maybe smoking) This means that the action in the body is usually quicker.

In November 2012 Tikun Olam, an Israeli medical cannabis facility, announced a new strain of the plant which has only CBD as an active ingredient, and virtually no THC, providing some of the medicinal benefits of cannabis without euphoria. The

Researchers said the cannabis plant, enriched with CBD, “can be used for treating diseases like rheumatoid arthritis, colitis, liver inflammation, heart disease and diabetes.” Cannabis CBD we speak about in this article, is legally derived from the hemp plant.

[Luxury CBD Now legal in all 50 states](#)

Because [CBD Oil](#) from the Hemp plant does not contain illegal amounts of THC, it is legal in all 50 states. This is very important to people all over the US who are in need of CBD but can't get it locally. In addition, legal [CBD is available for home delivery in all 50 states](#) meaning many people don't have to relocate to a state with legalized Medical Marijuana. Also in states where medical marijuana is legal, consumers using this hemp plant form of CBD don't have to go through the hassle and for some the embarrassment, of getting a medical marijuana card.

Additional, preclinical studies suggest that [CBD](#) may have therapeutic benefits in the treatment of various conditions, including chronic pain, anxiety, nausea, rheumatoid arthritis, schizophrenia, diabetes, PTSD, alcoholism, strokes and cardiovascular disease, cancer, and other ailments.

The Best Part

“It does NOT have a high potential for abuse, and there are very legitimate medical applications.” says Gupta.

[Luxury CBD E-liquid](#) uses proven, natural ingredients that are toxin-free. CBD is 100% natural and does not contain any dangerous or synthetic chemicals or stimulants.

The best part of [Cannabis CBD E-liquid](#) is it does not contain THC. The THC is the chemical that gets Marijuana smokers “High.” The fact is that the medicinal value of the plant, comes from the CBD, not the THC.

- *No prescription*
- *No THC*
- *Not tested in drug screenings*
- *Legal in all 50 States*

The above, does not suggest that the CBD products mentioned in this article cure or are used to treat any specific ailments.

Still have questions about CBD? We may have the answers below for you!

What is [CBD?](#)

Luxury or CBD is a non-intoxicating component of the cannabis plant with enormous therapeutic potential. Although CBD doesn't make people feel high like THC does,

it's causing quite a buzz among scientists, health professionals and medical marijuana patients who are using CBD-rich products to treat a wide range of conditions including chronic pain, cancer, Crohn's, diabetes, rheumatoid arthritis, PTSD, cardiovascular disease, anxiety, antibiotic-resistant infections, multiple sclerosis, schizophrenia, and more.

Academic research centers in the United States and elsewhere are currently studying the effects of CBD on these and other ailments. Scientists refer to CBD as a "promiscuous" compound because it confers therapeutic benefits in many different ways while tapping into how we function physiologically and biologically on a deep level. Extensive preclinical research and some clinical studies have shown that CBD has strong anti-oxidant, anti-inflammatory, anticonvulsant, anti-depressant, anti-psychotic, anti-tumoral, and neuroprotective qualities. CBD can change gene expression and remove beta amyloid plaque, the hallmark of Alzheimer's, from brain cells.

Which is better: CBD or THC?

CBD and THC (the high causer) are the power couple of cannabis therapeutics; they work best together. CBD and THC interact synergistically to potentiate each other's curative qualities. CBD enhances THC's painkilling and anticancer properties, while lessening THC's psychoactivity. CBD can also mitigate adverse effects caused by too much THC, such as anxiety and rapid heartbeat.

When both compounds are present in sufficient amounts in the same cannabis strain or product, CBD will lower the ceiling on the THC high while prolonging its duration. ("Relaxing but not intoxicating" is how one patient described CBD-rich cannabis.) CBD broadens the range of conditions treatable with cannabis, such as liver, cardiovascular and metabolic disorders, which may be less responsive to THC-dominant remedies. CBD and THC both stimulate neurogenesis, the creation of new brain cells, in adult mammals.

What's the best way to take CBD?

The most appropriate delivery system for CBD-rich cannabis is one that provides an optimal dose for a desired duration with few unwanted side effects. CBD-rich cannabis flower varieties for smoking or vaping are available in many medical marijuana dispensaries, but most CBD patients prefer non-inhalable products made with cannabis oil concentrates.

Although banned by federal law, measurable doses of potent CBD-rich cannabis remedies are available in many non-smokable forms and can be used in various ways. The time of onset and duration of effect vary depending on the method of administration. CBD-rich cannabis oil products can be taken sublingually, orally (as edibles, lozenges, beverages, tinctures, and gel caps), or applied topically. Concentrated cannabis oil extracts can also be heated and inhaled with a vape pen. Inhalation is good for treating acute symptoms that require immediate attention; the

effects can be felt within a minute or two and typically last for a couple of hours. The effects of orally administered CBD-rich cannabis oil can last for four hours or more, but the onset of effects is much slower (30-90 minutes) than inhalation.

Can CBD cure epilepsy?

Marijuana has a rich history as a medicine for quelling seizures and convulsions going back thousands of years. In the mid-19th century, the U.S. Pharmacopeia listed cannabis tincture as a treatment for pediatric epilepsy, and subsequent scientific studies have documented the anticonvulsant effects of CBD, THC, and whole plant cannabis. CBD-dominant/low-THC cannabis strains and oil extracts can facilitate dramatic improvement in some children with intractable seizure disorders.

Between 10-15 percent of severe childhood epileptics who are given CBD oil products experience a near complete cessation of seizures; most improve (with a decrease but not total elimination of seizures); and some children have worse seizures when they take CBD. Many parents of epileptic children have learned through trial and error that augmenting CBD-rich oil by adding some THC—or better yet, THCA, the unheated, non-psychoactive form of THC that's present in raw cannabis flowers and leaves—helps with seizure control.

The take-home message: Low-THC cannabis oil products don't work for everyone. Patients of all ages need access to a wide spectrum of whole plant cannabis remedies, not just high CBD oil.

What is the right CBD:THC ratio for me?

Cannabis therapeutics is personalized medicine. There is no single ratio or strain or product that's right for everyone. Optimize your therapeutic use of cannabis by finding the proper combination of CBD and THC that works best for you. A person's sensitivity to THC is a key factor in determining the appropriate ratio and dosage of CBD-rich medicine. Many people enjoy the cannabis high and can consume reasonable amounts of any cannabis product without feeling too high or dysphoric. Others find THC unpleasant. CBD can lessen or neutralize the intoxicating effects of THC.

So a greater ratio of CBD to THC means less of a high. In some states with medical marijuana laws, cannabis oil concentrates and other products with varying ratios of CBD:THC are available so users can adjust or minimize psychoactive effects to suit their needs and sensitivities. Those who don't like THC have the option of healing without the high by using a CBD-rich remedy with only a small amount of THC. But a low THC remedy, while not intoxicating, is not always the most effective treatment option. In essence, the goal is to administer consistent, measurable doses of a CBD-rich remedy that includes as much THC as a person is comfortable with.

Are specific CBD:THC ratios better for different conditions?

Some patterns are beginning to emerge. For anxiety, depression, spasms, psychosis, and seizure disorders, many people report they do well starting with a small dose of a CBD-rich remedy with little THC. For cancer, autism, and many other diseases, some say they benefit more from a balanced ratio of CBD and THC. Extensive clinical trials conducted outside the United States have shown that a 1:1 CBD:THC ratio can be effective for neuropathic pain.

Some people use cannabis products with different CBD:THC ratios at different times of the day (more THC for sunlight hours, more CBD at night). Almost any cannabis strain or product theoretically could benefit a wide range of autoimmune and inflammatory disorders because THC and other cannabis components activate the CB2 cannabinoid receptor, which regulates immune function. Note: The CBD:THC ratio is not an indication of how much CBD or THC is present in a given cannabis product or strain.

What is the optimal dosage of CBD?

An effective dosage can range from as little as a few milligrams of CBD-enriched cannabis oil to a gram or more. Begin with a small dose of high CBD/low THC oil, especially if you have little or no experience with cannabis. Take a few small doses over the course of the day rather than one big dose. Use the same dose and ratio for several days. Observe the effects and if necessary adjust the ratio or amount. Don't overdo it. Cannabis compounds have bi-phasic properties, which means that low and high doses of the same substance can produce opposite effects.

Small doses of cannabis tend to stimulate; large doses sedate. Too much THC, while not lethal, can amplify anxiety and mood disorders. CBD has no known adverse side effects, but an excessive amount of CBD could be less effective therapeutically than a moderate dose. Less is more is often the case with respect to cannabis therapy.

What should one look for when choosing a CBD-rich product?

Look for products with clear labels showing the quantity and ratio of CBD and THC per dose, a manufacturing date, and a batch number (for quality control). Select products with quality ingredients: No corn syrup, trans fats, GMOs, artificial additives, thinning agents or preservatives. CBD-rich products should be lab tested for consistency and verified as being free of mold, bacteria, pesticides, solvent residues, and other contaminants. Best to avoid products extracted with toxic solvents like BHO, propane, hexane or other hydrocarbons. Opt for products that utilize safer extraction methods such as supercritical CO₂ or food-grade ethanol.

If CBD is so good, won't Luxury CBD be even better?

Single-molecule CBD will inevitably become a federally approved Big Pharma medicine. Products infused with a crystalline CBD isolate, derived and extensively refined from industrial hemp, are already being marketed by unregulated internet storefronts. But single-molecule CBD is less effective therapeutically than whole plant CBD-rich oil extract. Scientific studies have established that synthetic, single-molecule CBD has a very narrow therapeutic window and requires precise, high doses for efficacy, whereas lower dose, whole-plant, CBD-rich treatment regimens are already showing efficacy for many conditions among patients in medical marijuana states.

Whether synthesized in a Big Pharma lab or derived from industrial hemp, single-molecule CBD lacks critical secondary cannabinoids and other medicinal compounds found in high-resin cannabis strains. These compounds interact with CBD and THC to enhance their therapeutic benefits. Scientists call this the entourage effect. Numerous cannabis compounds have medicinal attributes, but the therapeutic impact of whole plant cannabis is greater than the sum of its parts.

Is there a difference between CBD derived from hemp and CBD derived from marijuana?

If you live in a state where medical marijuana is legal and available, look for CBD products made from high-resin cannabis (rather than low resin industrial hemp) that are sold in medical marijuana dispensaries. Hemp-derived CBD-infused products of varying quality are also available via dozens of internet storefronts. Compared to whole plant CBD-rich cannabis, industrial hemp is typically low in cannabinoid content. A huge amount of hemp is required to extract a small amount of CBD, thereby raising the risk of contaminants because hemp, a bioaccumulator, draws toxins from the soil.

That's a great feature for restoring a poisoned ecosystem, but it's not recommended for extracting medicinal oil. Heavily refined CBD paste or terpene-free CBD powder is poor starter material for formulating CBD-rich oil products. The FDA has tested dozens of so-called CBD "hemp oil" products and found that in many cases these products contained little or no CBD. CBD-infused nutraceuticals have not been approved by the FDA as food supplements; nor are these products legal in all 50 U.S. states. By and large, however, interstate CBD commerce is tolerated by federal authorities.

Is it safe to inhale hemp CBD oil fumes from a vape pen?

Many cannabis- and hemp-derived CBD vape oil products include a thinning agent, which dilutes the oil that is heated and inhaled by vape pen users. Beware of vape pen oil that contains propylene glycol. When overheated, this chemical additive produces formaldehyde, a carcinogen, as a byproduct, according to a 2015 report in the New England Journal of Medicine. Why do so many vape oil products contain

this thinning agent? It's because of the dubious quality of the extracted material from which these unregulated cannabis oil products are made.

Does CBD have any adverse side effects? What about drug interactions?

CBD is a very safe substance, but patients taking other medications should check with their doctor about drug interactions, which are more likely when consuming high doses of single-molecule CBD products. At sufficient dosages, CBD will temporarily deactivate cytochrome P450 enzymes, thereby altering how we metabolize a wide range of compounds, including THC. Cytochrome P450 enzymes metabolize more than 60 percent of Big Pharma meds. CBD is a more potent inhibitor of cytochrome P450 than the grapefruit compound Bergapten, so ask your doctor if grapefruit interacts with your medication. If grapefruit does, then CBD probably does, too. Patients on a CBD-rich treatment regimen should monitor changes in blood levels of prescription medications and, if need be, adjust dosage.

Will Big Pharmaceutical companies control the CBD market when cannabis is legalized for adult use?

Only if we let them. Cannabis is a medicinal herb and it should be regulated as an herb, not as a pharmaceutical or a street drug.
